

## **Environment Essay Writing: SAMPLE 1**

The natural environment consists of two major components: living and non-living things. The living components, as the name implies, include all lifeforms on earth, from microscopic microbes to gargantuan blue whales. Non-living components of the environment include all the spheres of the earth, (such as hydrosphere and lithosphere), physical, chemical, and other natural forces.

The interaction between these components is crucial for life. However, anthropological activities have affected the dynamics, resulting in an imbalance. For instance, the greenhouse effect is a natural phenomenon that has been around for millions of years. It is also a crucial process necessary for sustaining life on earth. However, since the Industrial Revolution, the levels of air pollution skyrocketed, pumping tremendous amounts of greenhouse gases into the atmosphere.

This magnified the greenhouse effect, eventually leading to global warming. And the consequences have been dire, for instance, the rising sea level is expected to submerge most cities near the coast by 2050. Torrential floods and storms will increase in their intensity. Draughts will be more severe and induce constant famine. Hence, anthropological activities must be kept under check because environmental pollution can take toll on the planet and ourselves.
